Description

A new era has dawned with TALEXX-LED. Now, high-quality light and optimum efficiency are no longer mutually exclusive. The versatile system solutions from Tridonic provide the basis for outstanding lighting designs that are future-proof, economical and eco-friendly in a wide range of applications.

LEDs come into their own in offices and educational institutions, in industry as well as technical working environments.

When designing LED lighting, there are certain differences compared to designs with conventional light sources. This design guide has been written to help you understand these differences. It answers all the most important questions you may have, such as on the right mechanical design, thermal management and optical conditions.

Complete system solution

LEDs offer major advantages in terms of general lighting: They are versatile, highly energy efficient and virtually maintenance free. With TALEXXengine STARK QLE you get a complete system solution from a single source comprising perfectly harmonised components: TALEXXmodule STARK QLE and TALEXXconverter.

The TALEXXengine STARK QLE offers impressive advantages:

- LED system solution with outstanding system efficiency of up to 101 lm/W consisting of a linear LED module and LED control gear
- Small colour tolerances of up to MacAdam 4
- Luminous flux of 1,250 lumen per LED module (hot lumen measurement at 65°C for technical specification under real conditions)
- High colour rendering (CRI >80)
- Colour temperatures of 3,000 K, 4,000 K and 5,000 K
- Option of combining multiple products, also with TALEXXengine STARK LLE
- Integrated emergency lighting function in combination with TALEXXmodule STARK QLE EM
- Emergency lighting compatible LED control gear in dimmable and non-dimmable versions
- Long lamp life of up to 50,000 hours
- Compliance with the mechanical and electrical standards of the luminaire industry

All information in this guide has been produced with the utmost care. However, the guide is subject to change without notice. Errors and omission excepted. Tridonic does not accept liability for possible damage resulting from the use of this guide. The latest version of this guide can be found at led.tridonic.com or from your sales partner.

Creative freedom

The square design with side lengths of 270 mm forms an ideal basis for fitting linear luminaires or square luminaires in compliance with the requirements of the particular application. The TALEXXengine STARK QLE can also be ideally combined here with the TALEXXengine STARK LLE linear LED module. Up to six LED modules can be operated with just one LED control gear. This makes it extremely to realise new design ideas.

The LED modules can be quickly wired up thanks to the push-in terminals.

This makes it extremely easy to both integrate efficient LED technology into existing luminaire designs or also realise new design ideas - irrespective of the optics as the TALEXXengine STARK QLE is suitable for all systems, from louvre to diffuser lights.

Warm and pleasant light

With excellent colour rendering and a choice of warm and neutral white colour temperatures, the LED system solution is a high-quality replacement for T5 and T8 fluorescent lamps - the result is pleasant and feel-good lighting.

Outstanding cost effectiveness

Compared to light installations with conventional lamps, TALEXX-LED reduces energy consumption by up to 40 percent. Its long service life means significantly lower maintenance and repair costs. Experience a new world of lighting with TALEXX-LED!

Summary of the chapters

To make it easier to find your way around the Design-in Guide, we have grouped the information on the TALEXXengine STARK QLE system into chapters: The guide begins with a system overview in which the different versions of the system are presented. The mechanical, electronic, optical and thermal aspects of the components are then described. At the end of the Design-in Guide, you will find ordering information and sources.

System overview

The TALEXXengine STARK QLE system is available in the CLASSIC version. The relevant components can be clearly assigned by their type codes.

Mechanical aspects

Depending on the particular situation, the LED control gear can be installed in the luminaire casing (inbuilt) or outside the casing (remote).

Dimensional drawings and installation instructions will help you to take account of the requirements of the particular situation.

Electrical aspects

The TALEXXmodule STARK QLE can be combined with a variety of LED control gear.

Electrical safety aspects, connection options, the connection between the LED control gear and the power supply and the connections are described and shown in the relevant wiring diagrams.

Optical aspects

The overall efficiency of the system is improved by choosing a reflector with suitable optical properties (e.g. beam angle) and dimensions. This chapter provides information on beam characteristics and illumination strength.

Thermal aspects

The modules of the TALEXXengine STARK QLE system are designed for operation without a heat sink. Information on life of the modules and temperature measurement is summarised in this section.

Ordering information and sources

Information on ordering heat sinks as well as where heat sinks, reflectors and accessories can be sourced can be found at the end of this document.

System overview

System versions

The TALEXXengine STARK QLE system is available in the CLASSIC and EM CLASSIC versions

Properties and functions	TALEXXengine STARK QLE CLASSIC	TALEXXengine STARK QLE CLASSIC EM
Colour temperature	5,000K, 4,000 K or 3,000 K	4,000 K or 3,000 K
Luminous flux	1,310 lm, lm1,250 lm oder 1,190 lm	1,250 lm or 1,190 lm
Colour rendering / colour tolerance	CRI > 80 / MacAdam 4 SDCM	CRI > 80 / MacAdam 4 SDCM
System efficiency ¹	101 lm/W	98 lm/W
DALI ²	Device Type 6 for LED control gear with dimming function	Device Type 6 for LED control gear with dimming function
DSI ²	yes	yes
switchDIM ²	yes	yes
corridorFUNCTION ²	yes	yes
Emergency light function ³	no	yes

¹ in combination with TALEXXconverter LCAI 080/0350 with a colour temperature of 5,000 K

² in combination with TALEXXconverter LCAI

³ in combination with EM PowerLED 2-4 W

Converters

Components

A uniform naming concept has been adopted for the components. The TALEXXengine STARK QLE system (quadratic LED Engine) comprises the following components:

- TALEXXmodule STARK QLE CLASSIC
- TALEXXconverter Suitable LED control gear with various functions are available for operation of the modules.
- The EM Power LED 2-4 W can be used for operation of a decentralised emergency light function. A TALEXXmodule is then operated with minimal luminious flux.

Information on components for emergency light functions can be found on the Tridonic homepage www.tridonic.com and the respective product pages.

Efficiency of the modules

The high efficiency of the TALEXXmodule STARK QLE results not only in energy savings but also in a reduction in the thermal load. This means that more compact luminaires can be designed.

Area of application

- > The components of the TALEXXengine STARK QLE system are suitable for indoor applications.
- > TALEXXengine STARK QLE is mostly used in protection class I luminaires.

Operating functions

DALI

DALI functionality enables the modules to be digitally controlled via the DALI signal (16-bit Manchester Code). The possible functions depend on the controller used.

The minimum and maximum dimming levels can be programmed.

The control input is protected against polarity reversal and accidental connection to mains voltage up to 264 V AC. The control line must be installed in accordance with the relevant directives on low voltage.

DSI

The DSI interface (Digital Serial Interface) allows luminaires to be controlled via a separate line, irrespective of the power supply cabling. If the room layout is changed, only the control line needs to be rerouted, the load line can be left unchanged. Switching on and off is controlled via the digital interface.

The low-voltage cable of the digital interface is polarity-free and can therefore be connected with either polarity to the DSI connection of the LED control gear.

TALEXXconverters with integrated DSI function are able to specify a minimum dimming value, maximum brightness and an emergency lighting value for all the connected operating devices in a control circuit. Using a digital interface ensures a consistent lighting level from the first to the last luminaire.

However, in contrast to DALI, the individual luminaires cannot be addressed separately.

switchDIM

The integrated switchDIM function enables a standard switch for dimming and switching to be connected directly. Pressing briefly on the switch (< 0.6 s) switches the LED control gear on or off. The last dimming value set will be recalled when the LED control gear is switched on.

Pressing the button for an extended period (> 0.6 s) serves to dim the connected module. The dimming direction (up/down) is changed when the switch is operated again.

Hold down the switch for about 10 seconds to synchronise all the connected devices to a dimming value of 50%. This prevents the LED control gear from starting at different dimming values or operating in the opposite dimming direction (e.g. with retrofit installations).

Switches with glow lamps affect the switchDIM function and should therefore not be used for this purpose.

corridorFUNCTION

TALEXXconverters one4all together with commercially available motion detectors enable the corridorFUNCTION: Presence-controlled lighting systems can be programmed without an additional controller so that the light is not switched off when no one is present and, instead, dimmed to a minimal level - and possibly only switched off completely after a preset period of time.

Type codes and versions

Type code for modules

The following type code is used to unambiguously identify the modules:

Type code for modules using STARK-QLE-270-1250-830-CLA-EM as an example

Desigr	nation	STARK	QLE	270	1250	8	30	CLA	EM
Meanir	ng	Product	Form	Width	Luminous flux in Im	Ra > 80	Colour temperature 3,000 K	Version	Feature

Type code for LED control gear

The following type code is used to unambiguously identify the LED control gear:

Type code for LED control gear using LCI 080/0350 ...as an example

Designation	LCI	080	1	0350
Meaning	LED control gear, constant current non-dimmable	Power in W		Current in mA

Type code for LED control gear using LCAI 080/0350 ...as an example

Designation	LCAI	080	1	0350
Meaning	LED control gear, constant current dimmable	Power in W		Current in mA

The precise type designation for the LED control gear is given on the type plate of the LED control gear.

Please note the system combinations with the matching components on the following pages. Ordering information on the components can be found at the end of this document.

Versions

TALEXXengine STARK QLE CLASSIC

The TALEXXengine STARK QLE CLASSIC system is an attractive entrylevel solution for general LED illumination. Depending on the application TALEXXconverters with and without a dimming function are available.

Characteristics

- Colour temperature 3,000 K, 4,000 K or 5,000 K
- Colour rendering index CRI > 80
- Lumen values: 1,190 lm at 3,000 K, 1,250 lm at 4,000 K and 1,310 lm at 5,000 K
- Low MacAdam 4 SDCM colour tolerance
- System efficiency of up to 101 lm/W with high energy savings and short payback time

Control functions

- ON/OFF via network with LED control gear without dimming function
- > DALI, DSI, corridorFUNCTION and switchDIM with LED control gear with dimming function

¹ Number of modules

Advantages and disadvantages of parallel wiring

- Advantages: SELV level protection class Several modules can be operated in parallel with just one LED control gear
- Disadvantage: Possible reduction in service life (if a module fails or a cable breaks, the current of the other modules increases), tolerance-related differences in brightness as well as larger amount of cabling.

Standards and directives

Standards and directives for modules

The following standards and directives were taken into consideration in designing and manufacturing the modules:

CE

2006/95/EG	Low-voltage directive: Directive relating to electrical equipment for use within certain voltage limits
2004/108/EG	EMC ¹ directive: Directive relating to electromagnetic compatibility

¹ EMC: Electromagnetic compatibility

RoHS

2002/95/EC RoHS-Directive¹: Directive on the restriction of the use of certain hazardous substances in electrical and electronic equipment

¹ RoHS: Restriction of (the use of certain) hazardous substances

Safety

DIN IEC 62031:2008	Safety requirements for LED modules
EN 60598-1:2008 und A11:2009	General requirements and tests for luminaires
EN 60598-2-2:1996 und A1:1997	Luminaires - Part 2. Special requirements; Main section 2: Recessed luminaires
EN 62471:2008	Photo-biological safety of lamps and lamp systems

Safety and performance

EN 61347-1:2009	General and safety requirements
EN 61347-2-13:2007	Special requirements for dc and ac powered electronic operating equipment for LED modules
EN 62384:2007 IEC 62384 A1:2009	Operational requirements

Energy labelling

EU Regulation No: 874/2012 "Energy labelling of electrical lamps and luminaires"	
--	--

Standards and directives for LED control gear

The following standards and directives were taken into consideration in designing and manufacturing the LED control gear:

EMI

EN 55015 2008	Limit values measurement methods for radio interference properties of electrical lighting equipment and similar electrical devices
EN 61000-3-2:2005 A1: 2008 und A2:2009	Limit values for harmonic currents (equipment input current < 16 A per conductor)
EN 61000-3-3:2005	Limit values for voltage fluctuations and flicker in low-voltage systems for equipment with an input current < 16 A per conductor that are not subject to any special connection conditions
EN 61547:2001	EMC ¹ requirements

¹ EMC: Electromagnetic compatibility

Safety

EN 50172 2005

Mechanical aspects

Installation

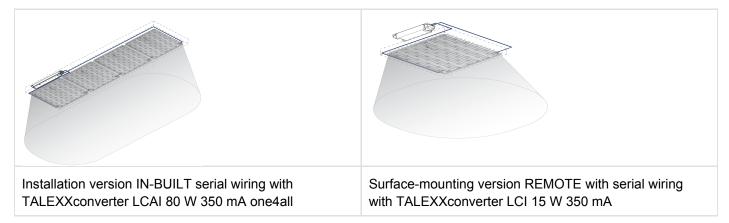

Installation details

EOS/ESD safety guidelines

The device/module contains components that are sensitive to electrostatic discharge and may only be installed in the factory and on site if appropriate EOS/ESD protection measures have been taken. No special measures need be taken for devices/modules with enclosed casings (contact with the pc board not possible), just normal installation practice.

Please note the requirements set out in the document EOS/ESD guidelines (Guideline_EOS_ESD.pdf) at: www.tridonic.com/com/en/technical-docs.asp

Installation example with TALEXXconverter and serial wiring

Installation example with TALEXXconverter and parallel wiring

Installation version IN-BUILT parallel wiring with TALEXXconverter LCI 50 W 1050 mA	Surface-mounting version REMOTE with parallel wiring with TALEXXconverter LCI 55 W 1400 mA

Installation details

Depending on the particular situation, the LED control gear can be installed in the luminaire casing (in-built) or outside the casing (remote).

LED modules are used together

Unobtrusive wiring thanks to cable penetration and cable return

Notes on installation

wiring

The following requirements must be met depending on the installation situation for the LED control gear and modules:

- Sufficient distance to active conducting materials
- Sufficient strain relief when the LED control gear cover is closed
- Sufficient cooling of the modules (the max. temperature at the tc point must not be exceeded)
- Unrestricted exit of light from the modules
- The module's spring terminals are designed for one-off wiring using solid conductors. The lines can be released by carefully unscrewing with solid conductors

1 NOTICE

Detailed information on the thermal connection and the position of the tc point is given at "Thermal aspects".

Protection measures against damage

Mechanical stress

TALEXX modules contain electronic components that are sensitive to mechanical stress. Such stress should be kept to an absolute minimum. In particular the following mechanical stresses should be avoided as these may cause irreversible damage:

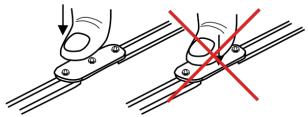

- Pressure
- Bending stress
- Drilling,
- Milling,

- Breaking,
- Sawing,
- and similar mechanical processing.

Compressive stresses

The components of the TALEXX modules (circuit boards, glob-top, lenses, electronic components etc.) are sensitive to compressive stresses. The components must not be exposed to compressive stresses.

- ▶ If glass or Plexiglas shields are used make sure that pressure is not exerted on the glob-top.
- Only touch the TALEXX modules at the edges

correct (left) and incorrect (right)

Bending stress

Bending the circuit board of a TALEXX module by more than 3 % along its length may damage the product and is therefore not permitted. 3 % corresponds for example to 6 mm for a 200 mm long module.

Max. bending stress for LED strip modules

Chemical compatibility

LED modules can be damaged by other materials, if these materials have certain chemical properties. The cause for these damages are different gaseous compounds, which penetrate into the encapsulant of the LED and thereby attack the encapsulant, the color conversion phosphor or the LED chips and can affect the electrical contacts or the substrate.

Application areas for chemical substances

The following are known areas in which chemical substances are used:

- use of protective coating in applications with high relative humidity (outdoor applications),
- encapsulation of LED modules,
- cementing of LED modules,
- sealing of luminaires.

The following materials must be checked for their safety:

- > All components and auxiliaries used in the assembly of the luminaire:
 - » Solvents of adhesives and coatings

- » Other so-called VOC ("volatile organic compounds")
- > All other additional substances present in the atmosphere:
 - » Outgassing of adhesives, sealants and coatings
 - » Cleaning agents and processing aids (e.g. cutting oils and drilling coolants)

I NOTICE

Contact your LED manufacturer for questions about the materials used and possible interactions and risks.

Putting together a "safe list" is not possible due to the complexity of the topic. The following table lists possible contaminants for LED modules, the classes of compounds and examples of possible sources. The list shows the most commonly used materials but does not claim to be complete.

Class of compounds	Chemical names	Occurs in
Acids	 » hydrochloric acid » sulfuric acid » nitric acid » phosphoric acid 	» cleaner» cutting oils
Organic acids	» acetic acid	 » RTV silicones » cutting oils » degreaser » adhesives
Alkalis	» ammonia » amines » sodium hydroxide	» detergents » cleaner
Organic solvents	 » ethers (e.g. glycol) » ketones (e.g. Methylethylketon) » aldehydes (e.g. formaldehyde) » aromatic hydrocarbons (e.g. xylene and toluene) 	 » cleaner » benzine » petroleum » paints and varnishes
VOC (volatile organic compounds)	 » acetate » acrylates » aldehydes » serve 	 » super glue » all-purpose glue » screw locking varnish » coatings » paints and varnishes
Mineral oils	» hydrocarbons	» machine oil» lubricants
Vegetable oils and synthet. oils	» siloxanes » fatty acids	» silicone oils» linseed oil» fats

Harder, vulcanizer	» sulfur compounds	» seals» sealants» colors
-----------------------	--------------------	---

Protection measures for the glob top material

The following guidelines must be observed to avoid damage to the glob-top:

- Make sure that the chemicals used in LED applications are not solvent-based, condensation crosslinked or acetate crosslinked (acetic acid). These give rise to reagents (e.g. solvent vapors, acetic acid) that may damage LED modules or the encapsulant. This applies to chemicals that are used not in the immediate vicinity of the modules (e.g. seals) and also to chemicals that come into direct contact with the modules (e.g. insulating coatings, adhesives).
- To ascertain the chemicals used and the type of cross linking a technical data sheet containing a list of substances must be requested from the manufacturer.

Example of damaged encapsulant material, recognizable by the change of the chromaticity coordinates:

Protection measures in regards to sealing

The points above also apply to chemicals used for sealing luminaire casings. If however the LED module is not installed in the luminaire until after the sealing compound has been completely cured (see relevant material information) the above points can be ignored.

If the LED modules have already been installed in the luminaire, possible damage to the encapsulant can be reduced to a minimum by ensuring adequate spacing (>10 cm) and ventilation (open casing and air circulation, extraction / fan) during the curing process.

Protection measures in regards to cementing

To avoid damaging the LED modules you must not use any tools or exert any pressure on the electronic components or the encapsulant.

- If glass or Plexiglas shields are used make sure that pressure is not exerted on the encapsulant.
- Only touch the LED modules at the edges

Instructions for cementing TALEXX modules

Preparation

Clean and durable bonding of two materials requires special attention. The following cleaning agents are recommended:

- Isopropanol / Water 50/50
- Acetone
- Heptane

Important aspects

Carrier material

The carrier material must have adequate thermal conductivity (e.g. aluminium). The size of the cooling surface depends on the power of the LEDs, among other things. For information on the cooling surface required, see the appropriate product data sheet.

Adhesive material

The carrier material itself plays an important role in selecting the adhesive material. The crucial factors are the coefficient of expansion and compatibility with the base material of the TALEXX module board (plastic or aluminium). This must be checked in the application in terms of long-term stability, surface contamination and mechanical properties.

- Surface quality The carrier material must be uncoated (thermal transport, adhesion) and level at the connection points.
- Installation temperature To achieve optimum adhesion we recommend you carry out this work at room temperature.
- Duration, optimum adhesive strengths

Maximum adhesion is achieved within 48 hours at room temperature; the process is accelerated by heat. In actual practice this means that at the maximum tc temperature (approx. 75-85 °C, product-specific) maximum adhesion is reached after about 12 hours. During the curing period make sure that there is no tensile load on the adhesive connection of the TALEXX module.

Additional information

TALEXX modules must not be stuck and restuck time and again without replacing the adhesive tape. Damaged adhesive tapes must be completely removed and replaced by new tapes.

Packaging and transport

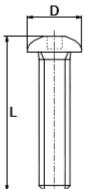

TALEXX products from Tridonic are delivered in appropriate packaging. The packaging provides special protection against mechanical damage and ESD (electrostatic discharge). If you need to transport TALEXX products you should use this packaging.

Installation of the modules

The LED modules are mounted with 4 screws per module. In order not to damage the modules only rounded head screws and an additional plastic flat washer should be used. Suitable screws should be selected on the basis of the following dimensions:

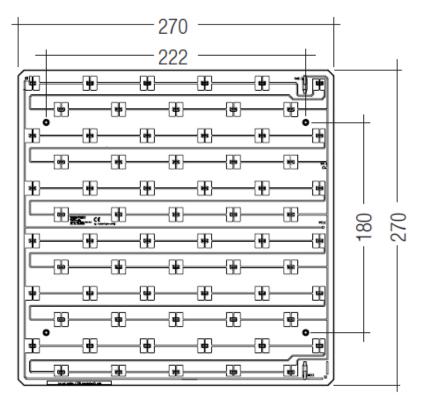

Dimensions of the fastening screws

Screw size	M4	
Max. diameter D	7 mm	t k
Min. length L	5 mm	
Max. length L	depending on the design of the luminaire	L

Electrical aspects

Electrical safety

Basic classification of protection classes

Depending on the design of the luminaire, the requirements of different electrical protection classes are satisfied:

Luminaires in protection class III (also SELV which stands for Safety Extra Low Voltage) have such low internal voltages that a shock current would be inconsequential. AC voltages with an effective value of up to 35 V AC and direct currents up to 60 V DC are referred to as low voltage (also extra-low voltage and weak current).

Protection class II (non-SELV) applies for luminaires with double insulation, with no protective earth, between the mains circuit and the output voltage or metal casing. Even if the luminaires have electrically conductive surfaces, thanks to their insulation they are protected against contact with other live parts.

Protection class I (non-SELV) applies for luminaires with basic insulation and protective earth. All the electrically conductive casing components are connected via a protective conductor system which is at earth potential.

Basic insulation of TALEXXmodule STARK QLE

The TALEXXmodul STARK QLE features basic insulation against earth, i.e., a clearance/creepage distance greater or the same as 3 mm and can be directly assembled on an earthed metal part of the luminaire, also in operation with the TALEXXconverter LCAI 80W 350mA.

Design measures for satisfying protection class requirements

Not all the components of the TALEXX STARK QLE system comply with the SELV standard. The voltages can thus be greater than 60 V DC.

Luminaire with SELV level

When using the LED module STARK QLE CLASSIC in combination with a TALEXXconverter in protection class SELV, the SELV level for the luminaire is achieved.

Thanks to SELV voltage, the luminaire can be replaced by an expert without risk.

Classification of the LED control gear in SELV and NON-SELV protection classes can be found in the LED control gear matrix.

Protection class II luminaires

When using a TALEXXconverter with NON-SELV level, the following measures are essential in order to achieve protection class II:

- Reinforced insulation between TALEXXmodule STARK QLE and the luminaire casing, e.g., by means of plastic casing or an additional insulating foil between the luminaire casing and the module.
- Reinforced insulation between the LED control gear and luminaire casing, e.g., by means of plastic casing
- Use of double-insulated lines
- Protect all electrical contacts against mechanical contact, this can typically be achieved with optics which cannot be removed

Protection class I luminaires

When using a TALEXXconverter with NON-SELV level, the following measures are essential in order to achieve protection class I:

- Use of metal casing for the luminaire
- Assembly of the TALEXXmodule STARK QLE directly on the casing
- Grounding of the LED control gear, TALEXXmodule STARK QLE and the luminaire itself
- Protect all electrical contacts against mechanical contact, this can typically be achieved with optics which cannot be removed

A DANGER!

The following measures must be followed in order to avoid lifethreatening situations:

- Electrical work on a luminaire with protection class I or II (non-SELV) must only be carried out by an electrically skilled person.
- ▶ The luminaire must be disconnected from the mains before starting work on it.
- Check the luminaire for damage, if there are any signs of damage, the luminaire must be replaced.

Electrical safety and connection

Electrostatic safety and EMC protection

The LED modules are tested up to a voltage of 8 KV static discharging. Depending on the ambient conditions, appropriate precautionary measures must be taken in order to avoid higher voltages, for example during production or installation.

For good EMC conduct, the lines should be run separately from the mains connections and lines. The maximum secondary line length on the terminals is 2 metres.

Electrical supply and selection of the LED control gear

TALEXXmodules STARK QLE are not protected against overvoltages, overcurrents, overloads and short-circuit currents!

Safe and reliable operation of the LED modules can only be guaranteed in conjunction with a LED control gear which complies with the relevant standards.

When using a TALEXXconverter, the following protection is offered:

- Short-circuit recognition
- Overload recognition
- Overtemperature switch-off

TALEXXmodules STARK QLE must be supplied by a constant current LED control gear. Operation with a constant voltage LED control gear leads to irreversible damage to the modules! Wrong polarity can damage the TALEXXmodules STARK QLE. If a wire breaks or a complete module fails in the case of parallel wiring, the current passing through the other modules increases. This may reduce the service life considerably.

Electrical connections

TALEXXmodule STARK QLE CLASSIC connections

The LED control gear is connected to the power supply and the connections of the control lines and the LED module via push-in and spring terminals:

Line cross-section and stripped length of the insulation on the LED module:

- Permissible line cross-section: 0.4 0.75 mm²
- Stripped length of the insulation 6 7 mm
- Push-in terminal for solid conductors

Push-in terminal for solid conductorsLine cross-section on the LED control gear with spring terminal:

- Permissible line cross-section: 0.5 1.5 mm²
- Stripped length of the insulation 8.5 9.5 mm
- Spring terminal for stranded wire with end splice or solid conductor

Spring terminal for stranded wire with end splice or solid conductor

Permissible line cross-sections and stripped insulation lengths of LED control gear with screw terminals can be found in the respective LED control gear data sheets.

0,4 – 0,75 mm ² 6 – 7 mm	0,5 – 1,5 mm ² 8,5 – 9,5 mm

Wiring diagrams

Wiring diagram for TALEXXengine STARK QLE CLASSIC with serial wiring and switchDIM

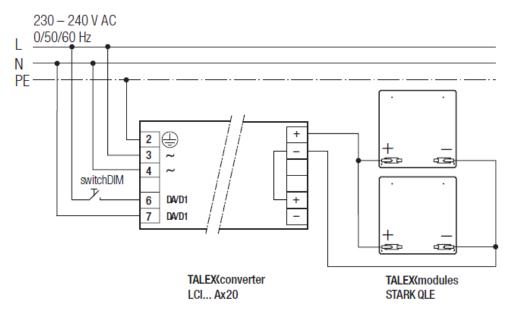

The wiring diagram shows serial wiring on a LED control gear with dimming function and 4 modules of type TALEXXmodule STARK QLE CLASSIC as well as connection of the LED control gear to the power supply and direct connection of a commercially available push to make switch.

Wiring diagram for TALEXXengine STARK QLE CLASSIC with serial wiring

The wiring diagram shows serial wiring on a LED control gear with 4 modules of type TALEXXmodule STARK QLE CLASSIC as well as connection of the LED control gear to the power supply.

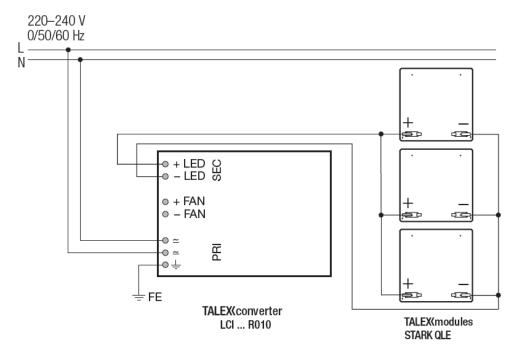

Wiring diagram for TALEXXengine STARK QLE CLASSIC with parallel wiring and switchDIM

The wiring diagram shows parallel wiring between a LED control gear with dimming function and 2 modules of type TALEXXmodule STARK QLE CLASSIC as well as connection of the LED control gear to the power supply and direction connection of a commercially available push to make switch.

With parallel wiring tolerance-related differences in brightness are possible. If one module fails, the remaining modules may be overloaded.

Wiring diagram for TALEXXengine STARK QLE CLASSIC with parallel wiring

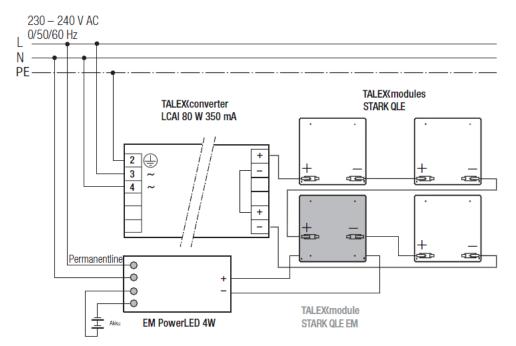

TRIDONIC Electrical aspects

The wiring diagram shows parallel wiring between a LED control gear and 3 modules of type TALEXXmodule STARK QLE CLASSIC as well as connection of the LED control gear to the power supply.

I NOTICE

With parallel wiring tolerance-related differences in brightness are possible. If one module fails, the remaining modules may be overloaded.

Wiring diagram for TALEXXengine STARK QLE CLASSIC and STARK QLE CLASSIC EM

The wiring diagram shows connection between a LED control gear and 4 modules with serial wiring, of which 3 modules are of type TALEXXmodule STARK QLE CLASSIC and 1 of type TALEXXmodule STARK QLE EM CLASSIC with emergency light function. The emergency light module is additionally operated by an emergency light supply device.

Furthermore, connection of the LED control gear to the power supply / charger of the emergency light supply device is shown.

TRIDONIC Optical Aspects

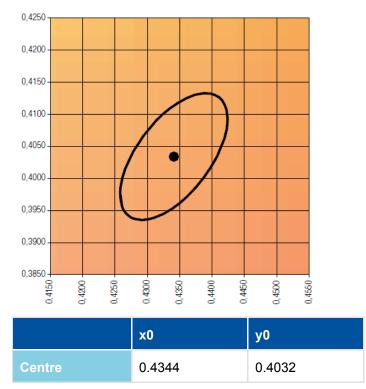

Optical aspects

Coordinates and tolerances

Light colours

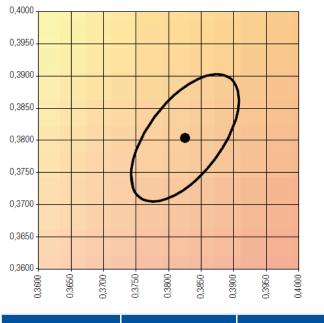

The TALEXXengine STARK QLE CLASSIC is available in the colours 3,000 K, 4,000 K and 5,000 K.

MacAdam Ellipse: 4SDCM 3,000 K

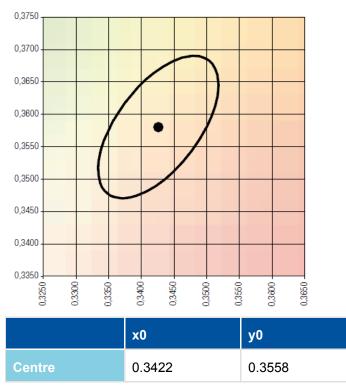

TRIDONIC Optical Aspects

Eye safety

Risk group	Evaluation
Actinic UV E _S (200 - 400 nm)	Risk group 0 ⁽¹⁾
Near UV E _{UVA} (315 - 400 nm)	Risk group 0 ⁽¹⁾
Blue light L _B (300 - 700 nm)	Risk group 0 ⁽¹⁾
Retina, thermal L _R (380 - 1,400 nm)	Risk group 0 ⁽¹⁾
IR radiation, eye E _{IR} (780 - 3,000 nm)	Risk group 0 ⁽¹⁾

⁽¹⁾ The evaluation of eye safety is based on EN 62471:2008 (photo-biological safety of lamps and lamp systems):

- Risk-free (risk group 0): The LEDs do not pose any photo-biological risk.
- Low risk (risk group 1): The LEDs pose a small risk because of normal limitations.
- Medium risk (risk group 2): The LEDs pose a small risk because of reactions to bright light sources or thermal discomfort.
- ▶ High risk (risk group 3): The LEDs pose a risk even with just momentary or temporary exposure.

Beam characteristics

Reflector and diffusers

With STARK QLE CLASSIC modules, the luminaire can be produced with either a diffuser or reflectors. There must be a minimum distance of 3 mm between the active parts and the conductive optical parts, e.g., reflector to the LED module.

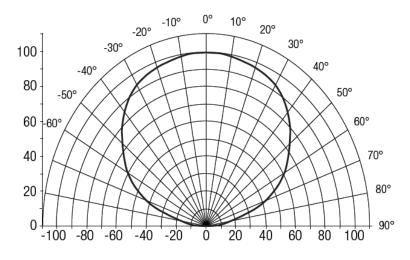

A CAUTION!

When using reflectors in combination with a non-SELV LED control gear, protection against contact must be ensured.

This is typically achieved with optics which cannot be removed over the module.

Beam characteristics of the TALEXXmodule STARK QLE

Maximum relative light intensity lv/v

Average illuminance in relation to the lumen values of TALEXXmodule STARK QLE

Installation height	Diameter of the beam	1,190 lm 3,000 K	1,250 lm 4,000 K	1,310 lm 5,000 K
0.25 m	0.75 m	1.958 lux	2,056 lux	2,130 lux
0.5 m	1.50 m	489 lux	514 lux	535 lux
0.75 m	2.25 m	218 lux	2228 lux	238 lux
1.0 m	2.99 m	122 lux	129 lux	134 lux

Beam angle = 116° LOR = 100%

i NOTICE

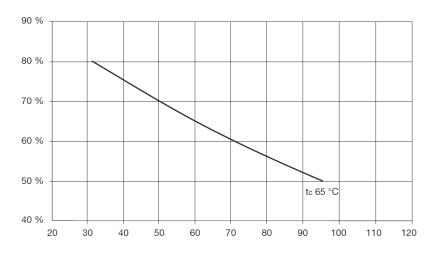

To aid customised design and for optical simulation, Tridonic is happy to provide the modules' CAD data on request. Sources of reflectors can be found at "Partners".

Thermal aspects

Cooling the modules

Effect of cooling on the life of the modules

The modules of the TALEXXengine STARK QLE system are self-cooling and a heat sink is not required. The life of the module depends to a large extent on the operating temperature. The more that the operating temperature can be reduced, the longer the expected life of the module. If the permitted operating temperature is exceeded, however, the life of the module will be significantly reduced.

Fall in luminous flux over the course of the service life:

The diagram shows the change in luminous flux in percent over an operating time of 1,000 h at different t_c operating temperatures.

Luminous flux	Operating time at t _c = 65 °C
80 %	30,000 h
70 %	50,000 h
50 %	90,000 h

Please check the information on the operating temperature and the requirements for cooling in the module data sheets.

Temperature measurement on the module

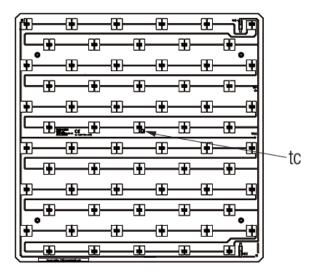

There is a t_c point on top of the module for checking the temperature of the latter:

The temperature at the t_c point can be measured with a simple temperature probe.

In practice, thermocouples (e.g. B&B Thermotechnik, K-type thermocouple) have proved successful. Such thermocouples can be attached directly to the t_c point with heat-resistant adhesive tape or a suitable adhesive. The measured values are recorded by an electronic thermometer (e.g., "FLUKE 51", VOLTCRAFT K202 data logger).

The maximum possible temperature must be determined under worst-case conditions (ambient temperature, installation of the luminaire) for the relevant application. Before the measurement is taken, the luminaire should be operated for at least 4 hours in a draught-free room.

The measurement must be taken in a steady thermal state and in a draughtfree room.

t_c point of the module

Temperature management of the LED control gear

Although the LED control gear have an integrated temperature management system, the requirements relating to cooling of the LED control gear must also be taken into account. Unintentional automatic dimming at overtemperature, for example, indicates inadequate cooling of the LED control gear.

The LED control gear temperature can be measured with a simple temperature probe at the t_c point. The t_c point of the LED control gear is indicated by a sticker on the casing.

i NOTICE

Measurement conditions, sensors and handling are described in detail in standard EN 60598-1 "General requirements and tests for luminaires".

Sources for suitable heat-conducting foil and paste for the thermal connection of a temperature probe can be found at "partners".

Product application and partners

Product application matrix

Whether you are looking for wide-area lighting or focused accent lighting, our wide range of TALEXX products will help you create an individual atmosphere and highlight specific areas exactly as you want. Our product portfolio includes individual light points, round, rectangular and strip versions. Specially matched operating equipment such as LED control gear, amplifiers and sequencers round off the components for a perfect system solution: They guarantee ideal operation and maximum efficiency.
